Are Managed IT Operations right for you? Here are 7 reasons you should be leveraging them

1. Is it difficult to find and hire the right staff for certain IT competencies?
   Recruiting and hiring people with expertise in security, cloud, applications, and disaster recovery isn’t easy. By outsourcing these functions to an MSP, you'll get the expertise you need without the time and cost of hiring and training.

2. Are you able to effectively detect and respond to security threats?
   With varying security alerts, IT teams often feel like a department chasing fires. MSPs provide Security and Network Operations Centers that provide proactive threat detection, response, and containment services that remove specific functions and improve security.

3. Are device and application patching hard to keep up with?
   MSPs maintain an inventory of all the devices and applications on your network. They can patch devices and ensure they're up-to-date, reducing the risk of vulnerabilities.

4. Do you maintain and regularly test your disaster recovery plan?
   When your critical apps and infrastructure go down, so does your business. MSPs help you maintain and test your DR plan to ensure you can continue to function during an unexpected event that would otherwise create downtime and revenue loss.

5. Is the performance of your critical apps where it needs to be?
   Even small performance issues have costly consequences—especially with remote employees. An experienced MSP will help you identify necessary performance levels and ensure you're always hitting them.

6. Are you able to have a consolidated view to monitor your entire IT estate?
   Monitoring your entire IT environment can be challenging. MSPs have the capability to give you a cloud view of your entire IT estate with integrated reporting.

7. Are device and application patching hard to keep up with?
   Patch management is a critical but often overlooked aspect of your cybersecurity. If you're too busy keeping up, APIs will do it for you, automating the process and ensuring you're always up-to-date.

It's time to bring in the experts
If you're struggling in any of these areas, Anexinet's Managed IT Operations were built to help. We will keep you up and running, provide the personal attention you deserve, and save you the heroic act of saving time that enables you – and your IT team – to focus on what really matters.
